Strategic Resources That Matter

A Civilization VII mod. Horses, Iron, Niter, Oil, Coal and Rubber matter again. A unit that draws on one of them fights weaker and trains slower while its owner holds no copy of it, and every copy you do hold still adds the game's own bonus, so the count keeps mattering. Lose your last copy, to a raid on the mine or a lost settlement, and the penalty is back a turn later. Past six copies, where the game's own bonus stops, the count keeps adding strength.

Figure 1: The unit panel of a Chariot with no Horses

A Chariot with no Horses: 27 Combat Strength instead of 30, and the line under its stats says why.

Single-player. In multiplayer, losing a resource does not bring the penalty back until that player gains a resource.

What the player sees

Nothing is forbidden. Every unit can still be trained and upgraded as in the base game. What changes is the price of going without:

- **No copy of the resource:** the unit has less Combat Strength (melee, and ranged and bombard where it has them), and a city puts less Production toward it, so it takes longer to train. With the default setting that is -3 Combat Strength and a third less Production, which makes the unit take half as long again.
- **One copy or more:** no penalty. The game's own +1 Combat Strength per copy applies as before, up to six copies.
- **More than six copies:** +1 more Combat Strength at 8, 10, 12, 14, 16, 18 and 20 copies, on the same units the game's per-copy bonus covers.

The game tells you why, in your language:

- **Unit panel:** when you select a unit that is short of its resource, a line under its stats says so: ”Unsupplied: no Iron (-3 Combat Strength, slower to train)”.
- **Combat preview:** the penalty is a line of its own beside the game's modifiers, for your unit and for the enemy's: ”-3 Unsupplied: no Niter”. Past six copies the extra strength shows as one line beside the game's own, such as ”+1 Niter: 8 or more copies”.
- **Production list:** a unit that needs a resource says so on its item, beside the game's own text: ”Needs Niter” in red while you hold none (the turn count shown is the slower one), ”Niter: 2” once you hold copies. Where the item has room for a sentence it reads ”Needs Niter. Without it: -3 Combat Strength, slower to train.” The line follows a copy gained or lost while the list is open.
- **Resources:** a strategic resource's description, on the map and in the commerce screen, ends with the units it supplies for you in this age: ”Supplies units: AT Gun, Assault Gun, Field Cannon and 3 more.” Resources that supply nothing in this age say nothing extra.
- **Civilopedia:** a page under Game Concepts, Combat, ”Strategic Resources That Matter”, with the rules and the table below; and on each gated unit's page a line such as ”Needs Iron: without a copy, -3 Combat Strength and slower to train”, with the penalty your game was set up with.

Which units need what

A civilization's unique unit needs what the unit it replaces needs.

Age	Units	Resource
Antiquity	Cavalry: Chariot, Horseman and their unique versions	Horses
Antiquity	Infantry from the second tier: Spearman, Phalanx, Legion, Immortal and the others	Iron
Exploration	Cavalry: Courser, Knight, Lancer and their unique versions	Horses
Exploration	Infantry from the second tier: Man-At-Arms, Pikeman and their unique versions	Iron
Exploration	Siege: Catapult, Trebuchet, Bombard, Hwacha	Niter
Exploration	Heavy warships from the second tier: Carrack, Galleon and their unique versions	Niter
Modern	Artillery: Field Cannon, Field Gun, AT Gun, Mortar, Howitzer, Assault Gun	Niter
Modern	Armour: Landship, Tank and their unique versions	Oil
Modern	Battleships: Dreadnought, Battleship and their unique versions	Oil
Modern	Light warships: Ironclad, Cruiser, Destroyer, Barbary Corsair	Coal
Modern	Aircraft	Rubber

A copy that reaches you over a trade route counts the same as one you mine yourself, from the turn the route lands.

Free of any requirement: the Warrior line and the Scout, ranged infantry (Archer, Crossbowman, Arquebusier), the Cog and the Ship of the Line, the Cuirassier, the Submarine, and Modern infantry, so every player can always defend.

Losing a resource

The game notices a new resource the moment it arrives: a mine finishing on Iron lifts the penalty on your Spearmen at once. It does not notice one going away. The mod makes it check every player again at the start of each turn, so a resource lost by pillage, by a tile changing hands or by anything else brings the penalty back one turn later, for you and for the AI players alike. A trade route ended by a war takes its copies with it at once; an import that dries up at the other end is gone from your count at once and the penalty follows one turn later. A player who still holds a copy keeps the bonus. The same check keeps the strength past six copies honest when the count falls.

Game setup options

Two options in game setup, beside the game's own options such as age length:

Option	Values	Default
Unsupplied Units	Off; Light (-2, 20% less Production); Standard (-3, 33% less); Harsh (-5, 50% less, twice as long to train)	Standard
Strategic Resources Past Six	Off; On (+1 at 8, 10, 12, 14, 16, 18 and 20 copies)	On

Play Now uses the defaults. The options are fixed for the whole game once it starts.

AI players

The AI plays under the same rules and needs no special handling: the penalty is ordinary unit and city data, and the turn-start check covers every major player. Independent powers and city-states are not penalised. In testing, an AI with no Iron kept building Warriors where, with Iron, it built Legions.

Compatibility

- Adds unit tags, modifiers and two game setup options. Changes no base-game row and replaces no base-game file.
- The unit panel line comes from a wrapper around the panel's own refresh, so mods that change the unit panel keep working. The production line goes in the slot the game keeps for mods on each production item, and the resource line into the text the game's description component draws; neither replaces a screen or a tooltip. Tested with Readable Tooltips, QD Improved Plot Tooltip, Building Location Advisor, City Hall, Better Commerce Screen UI and Mod Commons.
- Mods that rewrite the game's per-copy resource bonus leave the penalty alone; the curve past six copies follows the base game's unit classes (read from code, not tested).
- Ships the Tower Settings Keeper, which runs first and keeps every mod's settings readable after a restart. The mod itself stores no settings.

More detail, by kind of mod: docs/compatibility.md.

Saves

The setup options and the unit data are fixed when a game is created. A game started with the mod needs it to load; adding the mod to a game already under way does nothing until a new game is started.

Install

Subscribe on the Steam Workshop, or copy the `strategic-resources` folder into `~/Library/Application Support/Civilization VII/Mods/` (macOS) or `%LOCALAPPDATA%\Firaxis Games\Sid Meier's Civilization VII\Mods\` (Windows), and enable it under Add-ons.

Known limits

- Single-player only. The turn-start check is a local call, not a network request, so in a multiplayer game the mod switches it off and says so in the game's log. There, a lost resource brings its penalty back only once that player gains some resource.
- A loss shows one turn later, not at once.
- The curve stops at 20 copies.

How it works

- `data/`: each unit that needs a resource gets one tag, `SR_SUPPLY_<NAME>`. Per age and setup value, every major player's units get the combat penalty and their cities the production cut, each cancelled by an equal bonus while the player holds a copy. The curve is a set of +1 bonuses behind higher copy counts. The files are written by `scripts/build-data.mjs` from the rules in `scripts/gate-map.mjs`.
- `ui/sr-recheck.js`: at the start of every turn, gains and drops one off-map copy of a resource nothing else reads, for every major player. Gaining a resource is what makes the game re-check a player's requirements at the next turn roll.
- `ui/sr-unit-panel.js`: the line on the unit panel.
- `ui/sr-production-line.js`: the line on a production item, in the game's `ProductionModInfo` slot.
- `ui/sr-resource-line.js`: the line in a strategic resource's description, added where the game's `Stylize` component draws that text.
- `ui/sr-registry.js`, `ui/sr-player-supply.js`, `ui/sr-supply.js`: the shared registry wrapper, engine reads and pure rules the three lines use, so they never disagree.
- `ui/settings-keeper.js`: the Tower Settings Keeper, unchanged.

The evidence for each of these, run by run, is in docs/verification-runs.md.

Development

Typed JavaScript checked by `tsc`, ESLint with size limits, and Node tests; no build step. See CONTRIBUTING.md.

```
npm install
npm run verify        # type check, lint, tests
npm run data          # rewrite data/ from the gate map
node scripts/deploy.mjs
